- Easy navigation with Intelligent Search
- Dashboard Data Analytics
- Transform report content into data tables, spreadsheets, dashboards or other analytic tools
- Captures content from EPIC, Cerner, Mckesson, Meditech, PeopleSoft, Infor and others
- Document Publishing
- Access and analyze on any browser, any device, anytime

At IronSafe, we know that having easy, fast, and secure access to your content is paramount to the functionality and success of your organization. We also know that scrutinizing and presenting that content can be overwhelming. Our fully web based intuitive solution can eliminate the need for analysts to manually aggregate data from multiple versions of a report and give you access to your data in any format on-the-go. IronSafe is designed to take the effort and worry out of analyzing, presenting, and safeguarding your organization's content in order to maximize your interoperability and protect you from cyber threats. IronSafe allows your organization to effectively and securely engage with your physicians, clinicians, or clients.

IronSafe is a cutting edge single-page web app that warehouses your document and report assets with security-based access authorization, fast search capacities, and data transformation tools to extract your content to data tables, spreadsheets, or pdf. In addition to all that, IronSafe has dashboard analytics so you can analyze your

data in charts and graphs right on your IronSafe dashboard. Do this all in one product: IronSafe.

## SECURE YOUR CONTENT

IronSafe improves your organization's cyber-security and protects your data from online predators. The IronSafe Report and Document Warehousing Distribution Solution creates a virtual security-enabled filing cabinet for all of your Hospital's reporting output. Secure entitlement at the department and/or user level grants users access to authorized content only, whether that be to an entire report or to only some pages of a report or document.

IronSafe's auditable tracking security and support feature shows you what content users have accessed, and when.

### **Securely Search for Content Across All Assets**

One of the key challenges every hospital organization has is finding related information across numerous different sources.

Our secure, enterprise-wide, intelligent search is a rapid way for users to research across all of their report and document assets in one easy step. Simply by using the enterprise search tool, a user can quickly find content across all or some of his or her report assets, then see all search hits in those reports and documents, whether access is to one page of a multi-page report, all pages of another report, several pages of yet another multi-page document, etc.

Users can also search within just the report being viewed, or have a layered dual search, one search being over all/some assets and a second being for additional content within the report currently being viewed.

Securely search content from a variety of application source outputs such as EPIC, Meditech, Cerner, PeopleSoft or McKesson. Enterprise search increases everyone's efficiency and grants each employee more time to focus on actual research and work tasks. This adds up to your entire organization having significantly increased efficiency.

## ANALYZE YOUR CONTENT

Users today are looking to go beyond simply having content delivered to them electronically. They want to activate and transform the data within reports or documents into

usable forms, such as databases and spreadsheets, and also aggregate that data into convenient charts and graphs on dashboards for their own rapid analysis.

To analyze the data contained within PDF and text reports, it is far more powerful for that data to be in database or spreadsheet format. IronSafe can extract data from reports into data tables.

You can also export IronSafe report content to spreadsheet format. Further, IronSafe can present charts and graphs of data essential for you to analyze, right on your IronSafe dashboard.

Best of all, it's easy to do. IronSafe's ReportDB automation tools instantly discover data fields within reports and documents, and suggest data table or spreadsheet layouts which you can easily and quickly accept or change. This setup is required once only for any given report, and IronSafe's layout automated discovery makes that setup exceptionally fast. IronSafe's ReportDB engine automatically extracts data from new reports into your database tables as the new data arrives. This frees you to get right to your analysis, and you can do that right in your IronSafe Dashboard, which displays data in highly customizable charts and graphs. IronSafe automatically updates these charts and graphs as new data arrives in automatically-ingested reports. You can choose from pre-determined charts and let IronSafe do the work for you, or you can tailor your own gauges and arrange your charts and content to conform to your specific needs.

IronSafe was founded with vision, experience, and incredible motivation to build an extraordinary state of the art report warehousing, data transformation, and analytics solution. At IronSafe, we continually seek to further understand our clients' goals and needs with the objective of empowering them to be high-performance organizations. We build lasting relationships with clients and strive to add value and efficiency to their processes.

We work with industries requiring high level data security, including large healthcare systems, financial services, and more.

We are passionate about creating exceptional products and we believe excellent professional service improves the world of healthcare delivery and lowers the operational costs of our customers.

“IronSafe provides a user friendly, secure, report repository for all of our AR, Patient Census, and Patient Accounting reports. In addition, IronSafe has a strong data extraction feature that allows many of our reports to be transformed into spreadsheets for further analytics of report content which our previous vendor didn't offer.”
